PREPARING THE POOL WATER

Basic Water Chemistry

Your Pool Pilot Digital is designed to produce chlorine on a daily basis. To monitor your system's efficiency, the water chemistry ranges and schedule of periodic checks outlined below should be followed.

IDEAL RANGE	IDEAL TEST SCHEDULE	EFFECT OF LOW/HIGH LEVELS	CORRECTIVE ACTIONS
1.0 To 3.0 ppm	Weekly	Low free chlorine: Not enough residual chlorine to safely sanitize pool water. <u>High free chlorine:</u> Corrosive to metallic fixtures in pool water. Can bleach swimwear and hair.	Low free chlorine: Check for combined chlorine level and shock as necessary. Increase purifier output to maintain a 1-3 ppm residual reading. <u>High free chlorine:</u> Decrease purifier output. Let chlorine dissipate normally until 1-3 ppm is achieved. In extreme cases, pool water can be diluted with fresh water or a chlorine neutralizer added. (Diluting will reduce salt and CYA. Check and adjust as needed.)
7.2 To 7.8	Weekly	Low pH: (acidic) Equipment corrosion, eye/skin irritation, plaster etching, rapid chlorine consumption <u>High pH:</u> (basic) Scale formation, cloudy water, eye/skin irritation, poor chlorine effectiveness	Low pH: Add sodium carbonate or soda ash <u>High pH:</u> Add muriatic acid or sodium bisulfate.
80 To 120 ppm	Monthly	stained/etched plaster and metal corrosion. <u>High TA:</u> Constant acid demand, difficulty in maintaining pH, and contributes to scale formation or cloudy	Low TA: Add sodium bicarbonate. <u>High TA:</u> Add muriatic acid often, a little at a time (may take a week or more to lower the TA). Aerate by pointing return jets toward the surface.
2500 To 3500 ppm	Monthly	Low Salt: Below 2,400 ppm causes premature cell failure and reduces chlorine production <u>High Salt:</u> Above 6,000 ppm can cause corrosion of metallic fixtures and will taste salty. <i>Note: AutoPilot can safely</i>	Low Salt: Add salt according to digital display on Pool Pilot unit or salt chart. <u>High Salt:</u> If undesirably high, partially drain and refill the pool with fresh water. (Diluting will reduce CYA. Check and adjust as needed.)
200 To 400 ppm	Monthly	Low CH: Etching of plaster, equipment corrosion <u>High CH:</u> Scale formation, cloudy water. Rapid buildup of scale may exceed the system's self-cleaning capability and require manual cleaning of the SuperCell.	Low CH: Add calcium chloride flakes. <u>High CH:</u> Partially drain and refill pool with fresh water to dilute. (Diluting will reduce salt and CYA. Check and adjust as needed.)
60 To 80 ppm 30 To 50 ppm	Monthly	Low CYA: destruction of chlorine by the UV rays from the sun. <u>High CYA:</u> Requires more chlorine to maintain proper sanitizer levels. <i>Note: CYA not needed for indoor or</i> <i>bromine pools.</i> CYA can be reduced to 30 – 50 ppm for Pool Pilot Digital TC/ORP or colder	Low CYA: Add cyanuric acid (1 lb/5000 gallons increases CYA 25 ppm) <u>High CYA:</u> Partially drain and refill pool with fresh water to dilute. (Diluting will reduce salt. Check and adjust as needed.)
	7.2 To 7.8 80 To 120 ppm 2500 To 3500 ppm 200 To 400 ppm 60 To 80 ppm	1.0 To 3.0 ppm Weekly 1.0 To 3.0 ppm Weekly 1.0 To 3.0 ppm Weekly 1.0 To 7.8 Weekly 7.2 To 7.8 Weekly 80 To 120 ppm 2500 To 3500 ppm 200 To 400 ppm 60 To 80 ppm 60 To 80 ppm	SCHEDULE 1.0 To 3.0 ppm Weekly Low free chlorine: Not enough residual chlorine to safely sanitize pool water. High free chlorine: Corrosive to metallic fixtures in pool water. Can bleach swimwear and hair. 7.2 To 7.8 Weekly Low pH: (acidic) Equipment corrosion, eye/skin irritation, plaster etching, rapid chlorine consumption High pH: (basic) Scale formation, cloudy water, eye/skin irritation, poor chlorine effectiveness 80 To 120 ppm Monthly Low TA: Eye irritation, pH "bounce", stained/etched plaster and metal corrosion. High TA: Constant acid demand, difficulty in maintaining pH, and contributes to scale formation or cloudy water conditions. 2500 To 3500 ppm Monthly Low Salt: Below 2,400 ppm causes premature cell failure and reduces chlorine production High Salt: Above 6,000 ppm can cause corrosion of metallic fixtures and will taste salty. Note: AutoPilot can safely operate with salt levels up to 35,000. 200 To 400 ppm Monthly Low CH: Etching of plaster, equipment corrosion of metallic fixtures and will taste salty. Note: AutoPilot can safely operate with salt levels up to 35,000. 200 To 400 ppm Monthly Low CH: Etching of plaster, equipment corrosion of metallic fixtures and will taste salty. Note: AutoPilot can safely operate with salt levels up to 35,000. 200 To 400 ppm Monthly Low CH: Etching of plaster, equipment corrosion of metallic fixtures and will taste salty. Note: AutoPilot can safely operate with salt levels up to 35,000. 60 To 80 ppm Monthly Low CYA: destruction o

! WARNING

Excessively high chlorine levels can cause premature cell failure and corrosion damage to pool fixtures and equipment.

! WARNING

Always follow the instructions on the manufacturer's label whenever adding chemicals to your pool.
