

Salt Chlorine Generator

Swimming Pool & Spa Purification System Model: DIG-220

Owner's Manual

Installation and Operation

This manual covers the installation and operation of the DIG-220 Chlorine Generator with associated manifold assembly.

IMPORTANT !

Read This Manual Before Installing or Operating

INSTALLER: This Document is Purchaser's Property and is to Remain with the Equipment Owner

CONTACT INFORMATION

Dear Owner:

Congratulations on your wise decision to make anAquaCal AutoPilot chlorinator a part of your home. Just add salt, and let your DIG-220 produce the chlorine to sanitize your pool or spa.

A wonderful thing happens to the salt after it is turned into chlorine and does the work of purifying the water—it turns back into salt and the process begins all over again.

Plus, the salt, being at a much lower level than even contact lens solutions, means no "salty" taste to the water for the average batherAnd, no more odors from harsh chlorine products.

"You can rest assured knowing your new chlorinator is of the highest quality and efficiency, and is designed and built to provide years of trouble-free operation."

No longer experience the discomfort and inconvenience of harsh chemical reactions like red eyes, green hair itchy skin, or faded swim wear Our

product makes it easy to retain a constant level of chlorine, purifying the water while making it soft and silky to the touch.

What We Need to Know If You need To Contact Us...

If you should need to callAquaCal AutoPilot for questions, service, or parts, please have the following information ready:

| Installer: | Date of Installation: |
|-------------------------|-----------------------|
| Control Unit DIG-220 | Control Unit |
| Model Type: | Serial Number: |
| SuperCell | SuperCell |
| Model Type: | Serial Number: |
| Pool Volume in Gallons: | |

1 INSTALLER - Please record the following information prior to instillation:

2 CHEMISTRY: (from a current water sample) NOTE RECOMMENDED LEVELS ON PAGE-24 & 25.

| Approximate Water Temperature | Total Chlorine (TC): | |
|-------------------------------|-------------------------|--|
| of pool: | Combined Chlorine (CC): | |
| Salt Level: | Free Chlorine (FC): | |
| Stabilizer (CYA): | Total Alkalinity: | |
| Calcium Hardness: | pH: | |

3 "VIEW SETUP" and "TEST POOL PILOT" information

Use the view set up menu, and test pool pilot menu and write down the results (see programming onpage-20)

CONTACT INFORMATION (CONTINUED)

To Contact the Factory...

If you have questions, please refer to our web site at<u>www.autopilot.com</u> for the latest manual revisions, additional information, and helpful service advice.

You can also call us at: (G) GH (Î GWe are here to serve you from 8:00 a.m. to 5:00 p.m. Eastern time, Monday through Friday. If calling after hours, our voice mail system will handle your call. Please be sure to leave your name, a complete address, and your telephone number

Or, if you prefer, you may FAX us at: (727) 824-0847. Be certain to provide your full address and a daytime telephone number.

SAFETY INFORMATION

Used and maintained properly, your chlorine generator will provide year-upon-year of safe and economical service. However, as with any mechanical or electrical device, to get the most from your equipment— while insuring personal safety for you and others—certain operational and maintenance factors must be observed.

Likewise, excepting a few minor owner-capable maintenance items (explained later in this manual), repair and service of your chlorinator must be performed only by experienced service personnel. Should you suspect your chlorine generator is not performing properly refer to the section in this manual entitled: "roubleshooting," to determine if a call for service is required.

Your installer can be one source of service, or AquaCal AutoPilot Customer Support personnel stand ready to assist you at: (800) 786-7751. For questions concerning installation, operation, service and upkeep, please contact your installer or AquaCal AutoPilot Customer Support. Warranties may be voided if the chlorinator has been installed, operated, maintained, or repaired improperly.

In addition to voiding the manufacture's warranty... unapproved installation methods, modifications, poor or incorrect maintenance, service by unqualified personnel, or improper use of the chlorinator may result in personal injury and/or property damage. For personal safetyand to avoid damage to equipment, follow all safety instructions displayed on the equipment and within this manual.

Safety Signals

Throughout this manual the following two safety signals are placed where particular attention is required. Please note "WARNING" relates to personal safety, while "NOTICE" signals promote avoiding damage to equipment.

| • | Failure to heed the following may result in permanent injury or death. |
|--------|---|
| | A "Warning" signal appears in this manual where special attention is required for personal safety. (Specific instructions will appear in this box.) |
| | |
| | Failure to heed the following may result in equipment damage. |
| NOTICE | Failure to heed the following may result in equipment damage. A "Notice" signal appears in this manual where special care is required to avoid equipment damage. (Specific instructions will appear in this box.) |

Follow all National Electric Codes (NEC) unless **\$**ate or Local guidelines supersede. When installing and using your DIG-220, basic safety precautions must always be followed, including the following:

The Pool Pilot DIG-220 is a salt chlorination system designed for pool or spwater purification. Although the DIG-220 is easy to use, it is important to read through the entire manual before attempting to operate the system.

How Your Chlorine Generator Works

The system requires a low concentration of dissolved salt (sodium chloride) in the wate The salt concentration level is normally maintained below the taste threshold. The DIG-220 automatically converts the salt into chlorine, which your pool/spa requires to remain sanitized and algae free. The chlorine reverts back to salt after treating the water.

Since the salt is constantly recycled, there is minimal loss during a swimming season. However, salt can be lost due to filter backwashing, rain water overflowleaks, or bather splashing/carry out... but <u>not</u> through evaporation.

The amount of chlorine required for proper sanitization will vary based on the pool size and various factors such as water temperature, bather load, exposure to direct sunlight, and special water features.

The water circulation pump must be operating for your DIG-220 to produce chlorine, so run time is one of several key components to maintaining the proper sanitizer levels. **Most installations require a minimum of eight (8) hours-per-day pump run time** to properly filter and sanitize the water

Control Overview

Following is a brief explanation of owner / operator control options. For full features of the Owner Options Menu, please see page-20 & 21. The MENU button is pressed to obtain access to the Owner Options Menu.

<u>Please Note</u>: This quick start section assumes the installer has already programmed the system for specific site parameters, has established proper water balance, and has pretreated water to 1 - 3 ppm chlorine.

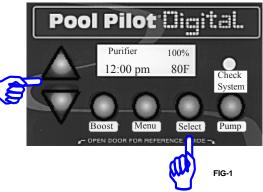

Attention Owner: Should Celsius vs. Fahrenheit, choice of language, or other owner options require modification, please refer to *Operation of Buttons* located on page-18 and *Owner Options* on page-20 & 21.

Up and Down Arrows:

Use the UP and DOWN arrows to control th**purifier output level**, then press the SELECT button to save the value chosen. With a properly prepared pool, the recommended starting output level is 50%.

Upon initial start-up, check sanitizer level every few days and make small output level adjustments as necessary to maintain 1-3 ppm free chlorine levels.

Your DIG-220 does *not* directly measure or regulate the sanitizer levels in your pool. Rather, the owner / operator will need to periodically test the water to determine the current chlorine level, and adjust the **output setting** as needed.

After the purifier output level is "tuned in," the unit will automatically make fine output adjustments as the water temperature fluctuates. This **patented** temperature compensation feature will adjust output depending on water temperature. See page-10 & 30 for more information concerning the temperature compensation feature.

<u>Please Note</u>: The **optimum output setting** will vary based upon pool size, location, exposure to sunlight, number of users, vegetation around the pool, water balance practices, and pump run timeYour installer should have already taken these factors into consideration when performing installation programming. Therefore, your adjustments, at this point, should be relatively minor

The Boost Button:

The BOOST button increases output to 100%. Use this feature when a heavier then normal bather load is anticipated.

Press BOOST once.....= 24-Hour Boost

Press and hold BOOST for 8 seconds = 72-Hour Boost

Press BOOST a second time.....= Deactivate Boost

Pool Pilot Digital

Menu and Select Button:

Allows access to the "Test," "View Setup," "Owner Options," "Maintenance," and "Installer" menus. The SELECT button allows the operator to choose program menu options. The owner / operator should <u>not</u> normally need to access these features on a regular basis. Consult "Programming" section or contact factory customer support for additional information.

Check System Light:

The CHECK SYSTEM light will flash to warn the DIG-220*may* need attention. A warning message will also be displayed. Unless deemed a normal condition, per below , see troubleshooting section beginning on page-31.

- Flashes if the water flow is insufficient under the following circumstances:
 - When DIG-220 is not set up to control the water pump (uses an External Timer or Remote Runs Pump), and DIG-220 is wired to the line side (hot al the time).
 - If the DIG-220 controls the pump (One-speed Pump), the light will not flash when the pump is off.
- Flashes when salt is low
- Flashes when water temperature exceeds 125° F, or drops below 10° F
- Flashes when "PUMP OFF FOR SERVICE"

Normal Display:

After 30-minutes of inactivity, the display will go to a "walking dot" screen saver modeAll functions such as chlorine generation, reverse, boost, etc., will continue in the background. Pressing any key will call up the normal informational display.

| Purifier Output level: | In 1% increments, from 0% to 100% |
|------------------------|-----------------------------------|
| Water Temperature | In Fahrenheit or Celsius |
| Cell Status | ON |

Water Balance & Chemistry Recommendations

Proper water balance is critical to the operation of your DIG-220.

Conditions such as high pH levels, low cyanuric acid (stabilizer) levels, or other factors causing *nbalanced water*, will mask the sanitizer production of your DIG-220. Please note the following recommended water chemistry parameters:

| PH | 7.2 – 7.8 |
|-----------------------------|----------------------------------|
| Calcium Hardness | 200 – 400 ppm |
| Total Alkalinity | 80 – 100 ppm |
| | 2500 - 3500 ppm (ideal 3000 ppm) |
| Cyanuric Acid (stabilizer) | 60 – 80 ppm |
| Chlorine | |

See "Basic Water Chemistry," on page-24 & 25, and "Using the Saturation Index," on page-25 & 26 for further information concerning pool/spa water chemistry maintenance requirements.

Should you have additional water balance or chemistry questions, please refer to the *roubleshooting* section in the back of this manual.

Important !!!

Information Critical to the Survival of Your DIG-220 Follows...

Winterizing

NOTICE

Failure to heed the following may result in equipment damage.

Special measures are required in the event of freezing conditions. Your DIG-220 may be damaged if measures are not taken in advance of freezing conditions. Equipment damage due to freezing conditions is NOT covered under the equipment warranty.

Freeze Protection & Extended Shut Down:

In areas where freezing conditions are a rare occurrence, allow the filtration system to run continuously throughout the freeze period. Typically, during light freeze conditions, circulating (moving) water will not freeze.

In areas where freezing conditions are prevalent and sustained, the DIG-22<u>MUST</u> be winterized; please refer to winterizing instructions onpage-30.

(CONTINUED)

Important Features

- Patented temperature compensation for chlorine output control...
- Programmable microprocessor control...
- Multi-language digital display (English, Spanish, Italian, & French)...
- Digitally controlled power to the SuperCell...
- Tri-sensor circuitry to monitor water flow water temperature, and salt level. Calculates and provides recommended salt addition amounts required to maintain the recommended 3000 ppm (3.0 g/l)) salt concentration level.
- Freeze Protection: allows the water pump, if wired and programmed for One-Beed pump, to override the program cycle and run continually (30-minute minimum) when the water temperature falls below 40° F (4.4° C). This helps to prevent damage to the plumbing during light freeze conditions.
- Optional Internal relay for controlling an external single-speed or two-speed water pump.
- On-board diagnostic and test programs.
- Lithium battery back up for saving program settings.
- ORP dry contact interface for connection to an external ORPcontroller.
- Opitional Electronic controller interface for Jandy[®] (Versions I,K, and newer), Polaris[®] EOS, or Pentair IntelliTouch[®] controllers.

Patented Temperature Compensation

The Tri-Sensor temperature sensor works in conjunction with the purifier % feature to automatically adjust chlorine output based upon changes in water temperature. The automatic compensation feature operates between $55^{\circ}F$ and $95^{\circ}F$ ($13^{\circ}C$ - $35^{\circ}C$).

As water temperature falls below 65°F (18°C), the controller will activate a high purifier percent lockout, and may not allow purifier adjustments up to 100%. This feature prevents the controller from overworking the cell under colder temperatures, thus preventing premature cell wear

At 55°F (13°C) or colder water temperatures, the controller will adjust to a fixed 1% output (and will not allow the percentage to be raised manually), thus preventing over-chlorination and premature cell failure.

As the water temperature rises above set point, the controller will increase output up to 100%, thus preventing under-chlorination during warmer water temperatures.

Water Manifold Assembly

The DIG-220 may be operated with the Patented (Automatic-Flow Bypass) Manifold using the following Super Cells: SC-36, SC-48, SC-60, or CC-15. Please see Insaller section: "Basic System Overview," for details and diagrams.

Get the Most from Your Purchase!

To become fully-familiar with all the features, the safe operation, and the care of your new chlorinator, please read through the entire remainder of this manual.

SPECIFICATIONS

This device complies with part 15 of the FCC Rules. Operation is subject to the following two conditions: (1) This device magtrcause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

Input Power:

230 Vac (1.5 AC amps) 50/60 Hz (default from factory) 115 Vac (3AC amps) (easily converted in the field, refer topage-14 & 15 for instructions on conversion)

Optional Internal Pump Relay Ratings:

Output Power:

Cell Power 1 (5* DC amps)

Cell Power 2 (6.5* DC amps)

Cell Power 3 (8* DC amps)

* Indicates nominal amperage output. The dual axis controller will slightly vary the amps to optimize the power to the cell.

Chlorine Output:

@ Cell Power 3 (8 amps DC)(set at 100% - 24 hour operation)

| CC-15 | 2.50 lbs/day | (1.13 | kg/day) |
|-------|--------------|-------|---------|
| SC-60 | 1.92 lbs/day | (0.88 | kg/day) |
| SC-48 | 1.56 lbs/day | (0.71 | kg/day) |
| SC-36 | 1.28 lbs/day | (0.58 | kg/day) |

Manifold Flow Requirements:

Voltage Input Amps / HP max

115 Vac 30 amps / 1 HP 230 Vac 30 amps / 2.5 HP

Maximum Operating Pressure: 50 psi

Maximum Flow Rate: 100 gpm Minimum Flow Rate: 20 gpm

Agency Approvals:

ETL tested to confirm to UL1081 specification. Standard for Safety for Swimming Pool Pumps, Filters and Chlorinators.

| | Circulation System components and related materials for swimming pools, spas/hot tubs. |
|--|---|
| | General Requirements For Safety of Household and Similar Electrical Appliances. See appendix on page-33 for CE Declaration of Conformity |

A Note Concerning Terminology:

Throughout this manual, the portion of the system which mounts to the wall (and powers the cell) may be referred to as the *IG-220* or *unit*. In addition, when "pool" is referred to in the absence of the word "spa," it should be assumed "spa" is inferred (should a spa be present in the installation).

Installer... Please record the following information on page-4 of this manual:

- Date of Installation
 SuperCell Serial Number
- SuperCell TypeControl Unit Serial Number
- Control Unit Model

For questions concerning installation or operation of this equipment:

Visit <u>www.autopilot.com</u> for latest manual revisions and helpful troubleshooting tips. You can also contact AquaCal AutoPilot customer support as specified onpage-5 of this manual.

Before Installing:

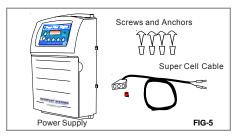

- Determine everything needed for installation is on hand.
- Determine where the Manifold Assembly will be plumbed.
- Identify a suitable mounting location for the DIG-220 within proper cord length to the manifold. If possible, avoid locations th direct sunlight, sprinklers, etc.
- Plan runs for SuperCell and Tri-Sensor Cables. (Cables are 12' or 3.65M)
- Plan wire runs and wiring connections for source power.
- Determine origination point for control center power feed:
 - Directly from a circuit breaker...
- Circuit breaker is used to power the DIG-220 and circulation pump.
- From an external timer, or DIG-220 is to be wired to the same location as the circulation pump; the unit is activated only when the
- From an electronic controller
 Circulation pump is energized.
- Determine whether the input voltage for the DIG-220 will be 15-Vac or 230-Vac
- Determine whether the DIG-220 will be used to control a single speed or a two speed pump. (Optional pump relay mst be instal)ed
- Determine whether the DIG-220 will be controlled by an ORP controller.
- Determine whether the DIG-220 will be controlled by an Electronic Controller System.

What is included:

Although the manifold assembly may be sold separately, both a manifold and a Digital Control Center are required for a completeinstallation. The standard cell & manifold assembly is available with the following cells: SC-36, SC-48, SC-60, and CC-15. Before attempting the installation, verify the followingters have been included with the Control Center:

| Quantity | Item Description |
|----------|---------------------------------------|
| 1 | DIG-220 Control Center / Power Supply |
| 4 | Screws and Screw Anchors |
| 1 | Drilling Template |
| 1 | Manual |
| 1 | 6 amp fuse, and wire jumper kit |
| 1 | Super Cell Cable |
| 2* | 68mm x 2" metric adaptors (#19059) |

* European systems only

What is not included:

- Power service electrical wire.
- ½" liquid tight (nonmetallic flex) conduit.

INSTALLATION

Required Components for a complete system:

Automatic-Flow Bypass Manifold Assembly:

The manifold is connected into the plumbing after all other equipment. Water from the pool/spa is moved though the manifold the circulation pump. The manifold's four key components are the: Strainer Screen, Tri-Sensor, SuperCell, and Bypass Flow Valve (See FIG-7).

The <u>Strainer Screen</u> prevents debris in the water from entering the Tri-Sensor or SuperCell, and requires periodic inspection and cleaning.

The <u>SuperCell</u> receives power from the DIG-220 and converts the salt contained in the water to chlorine.

The **Bypass Valve** allows the water flow rate to be slowed and optimized through the SuperCell, while permitting the pump to continue to circulate water to-and from the pool/spa at full flow rates. The slowed water flow through the SuperCell results in a more efficient "Super-Chlorination" effect, resulting in improved overall sanitization.

The <u>Tri-Sensor</u> provides data (from electronic sensors) to the DIG-220 for monitoring water flow, water temperature, and salt concentration level. The DIG-220 uses this data to determine if conditions are safe for the SuperCell to operate; the signal read from the temperature sensor allows the automatic temperature compensation feature to function (See FIG-8).

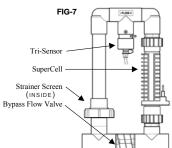

When the water flow reaches a minimum flow rate of 20-gpm (76 L/m), the flow paddle magnet closes a microswitch monitored by the Control Unit.

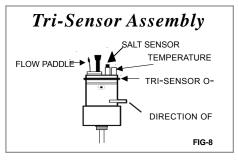

The Control Unit uses the Tri-Sensor dedicated salt sensor blades to measure the level of salt in the water.

The Control Unit uses the Tri-Sensor temperature sensor to determine water temperature. This measurement is required for the PatentedAutomatic Temperature Compensation feature to automatically adjust chlorine output as water temperature varies.

Less chlorine is needed in cold water, so chlorine output is automatically reduced as water temperature drops (avoiding excess chlorine production). Conversely more chlorine is needed in warmer water and production is automatically adjusted higher as water temperatures increase.

<u>Note</u>: The use of high strength magnet devices in the close proximity of the Tri-Sensor can cause the flow switch to function incorrectly.

Installation Steps:

Details on each step of the installation process are presented on the following pages:

- 1. Plumbing the Manifold Assembly (page-12 & 13)
- 2. Mounting the Control Unit (page-13 & 14)
- 3. Electrical Connections
 - a. Grounding and Bonding (page-14)
 - b. Determine Incoming Voltage Requirements (page-14 & 15)
 - c. Connecting DIG-220 to External Equipment (page-15 & 16)
 - d. ORP Connection (page-16)
 - e. SuperCell cable (page-16)
 - f. Tri-sensor cable (page-16)
- 4. Preparing the Water (page-17)
- 5. Programming and Setup for Site Parameters. (page-18, 22, & 23)

Plumbing the Manifold Assembly:

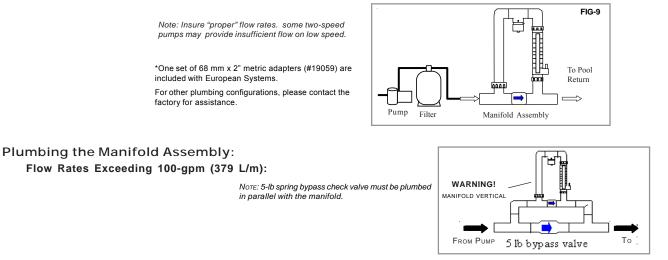

The Manifold Assembly is 2" Schedule 40 PVC, and is typically plumbed into the pool return line; and, if applicable, after theater and spa return diverter valve. Installing the manifold in the spa return line, will cause an excessive amount of chlorine to be introduced into the spa, while the spa is in use and stable avoided. **STEP-1:** Select the location for installing the manifold:

- **STEP-1**: Select the location for installing the manifold
 - It is recommended the manifold be installed prior to the installation of the Control Unit. The Control Unitust be installed close enough to the Manifold Assembly to allow the Tri-Sensor and SuperCell cables sufficient slack to enable component service and maintenance. The cables e 12' long.
 - The assembly <u>must</u> be installed in a vertical orientation as illustrated in the diagram on page-13 (fig 9). This orientation prevents hazards gas buildup in the system, should the flow switch fail to detect insufficient flow. WARNING! Place manifold in vertical position ONLY.
 - The direction of the water flow through the manifoldmust be as indicated for the system to operate properly
 - For a Pool/Spa combination, the manifoldmust be located as the last component in the POOL RETURN LINE (to avoid over-sanitization of the spa).

Plumbing the Manifold Assembly Continued:

Flow Rates Within Normal Range:

- The manifold can be directly plumbed into the system as shown.
- If the flow rate for the system is less than 20-gpm (76 L/m), a larger pumpust be installed (or steps taken to improve flow rate).

STEP-2: Install the cell into the manifold with the cell cable terminals at the bottom of the manifold as illustrated in picture (fig)1

| NOTICE |
|--------|

Failure to heed the following may result in equipment damage. If the cell is improperly installed upside down, water from rain or other sources may enter the cable contacts and result in failure of the Supercell. This would void the warrantly.

STEP-3: Tighten the unions by hand for a watertight seal. The manifold will accept an SC-36, SC-48, SC-60 or CC-15 cell; use of any other cell may damate power supply and the equipment warranty will be voided.

STEP-4: Follow the procedures outlined in the maintenance section orpage-28to verify proper operation of the Tri-Sensor Flow Switch protection.

| | Failure to heed the following may result in equipment damage. |
|--------|---|
| NOTICE | It is extremely important to verify the safe and proper operation of the Tri-sensor's Flow Switch protection device before operating equipment. |
| | |
| | Failure to heed the following may result in equipment damage. |

Mounting the Control Unit:

Your DIG-220 is suitable for indoor or outdoor mounting. If it is connected to 230 ¥c, it must be installed at least 5'(1.5m) horizontal distance from the pool or spa wall (or more if local codes require). It it is connected to 15 Vac, it must be installed at last 10'(3m) horizontal distance from the pool or spa.

The DIG0-220 is designed to mount vertically on a flat surface with the wiring inputs facing downward. The enclosure is designed to allow heat to dissipate from inside the box. It is important not to block the top or bottom of the box. Do NOT mount the unit inside a panel or a tightly enclosed area with proper ventilation.

The cover of the DIG-220 is removed from the sides by four thumbscrews so it is advisable to leave adequate space on the sides hand access to the thumbscrews.

When selecting a location for installing the DIG-220, please note that the Tri-Sensor and SuperCell cables are 12' (3.6m) long.

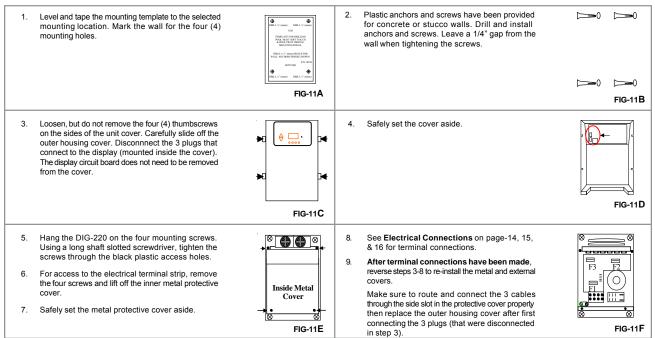

Failure to heed the following may result in equipment damage.

Verify that the selected DIG-220 location is close enough to the Manifoldssembly so that the Tri-Sensor and Supercell cables will have enough slack for service or maintenance procedures.

Mounting the Control Unit Continued:

Read the following section complety before proceeding (damage to wires and connectors may occur):

Electrical Connections

The DIG-220 uses both high and low voltage connections. High voltage connections will be made for providing the direct input wer. Additional high volgate connections may be made to the filter pump from the DIG-220. Low voltage connections will be made to the Tri-Sensor and Supercell. Additional low/ltage connections are provided for optional equipment such as a pH/ORP or electronic controller.

Failure to heed the following may result in permanent injury or death.

Insure the electrical panel or filter pump circuit breaker is turned OFF before wiring the DIG-220. Follow all state, local, IQE CEC codes as applicable. AquaCal Autopilot recommends a licensed electrician or certified electrical contractor perform the electrical connections.

Grounding and Bonding

Connect a ground wire from the primary electrical input to the grounding lug located inside the box. Also ground any piece digh voltage equipment that is connected to the DIG-220 relay. The DIG-220 must also be connected to the pool bonding system with an **A**WG (6 AWG for Canada) wire. Alug is provided on the bottom exterior of the unit.

Determine Incoming Voltage Requirements

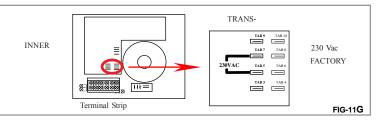

AC LINE IN

The DIG-220 is pre-wired from the factory for 230 \u00ed c using a 3-ampere fuse on the AC input. Short test leads are attached to the AC terminal strip and must be removed prior to installation.

if 115 Vac input power is required please follow step in section entitled "For incoming volage of 115 Vac" on pages-15.

For incoming voltage of 230 Vac:

For incoming voltage of 230 Vac, confirm the "TRANSFORMER PRIMARY" is wired as indicated in FIG-11G.

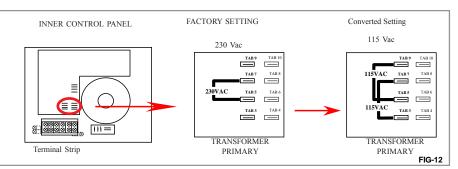

For incoming voltage of 115 Vac: For incoming voltage of 115 Vac, re-wire the existing jumper then add the jumper wire provided in the inallation kit, as shown on the circuit board marked "Tansformer Primary". (see fig 12)

Step 1:

remove the cover to access the inner control panel (see page-14 for more information). Rewire jumper as shown on this page on the circuit board marked "TRANSFORMER PRIMARY" (using included jumpers).

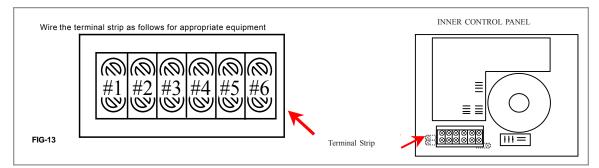

Step 2:

Replace the 3 ampere fuse at the lower left corner of the inner control panel with a 6 ampere fuse from the installation kites fuse location in the reference section on page-27.

Connecting DIG-220 to External Equipment:

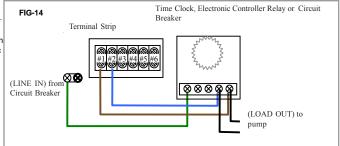

You must provide the appropriate gauge wire for complete installations to External Time Clock, One-Speed Pump, or Two-Speed Pump connections. Select the diagram that matches your application . (Wiring diagram also located on inside of cover):

Connecting DIG-220 to External Time Clock:

LINE-IN:

- 1. Remove and discard factory "test " wires from terminals 1, 2, and ground.
- Connect AC wires from Terminals #1, #2, and ground lug of the DIG-220 2. to the LOAD SIDE of the time clock, or the same location as the circulation pump wires (pump connected to circuit breaker, time clock or electronic controller).

Continued Next Page...

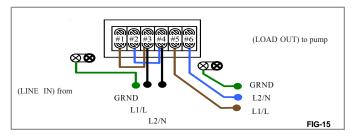

Connecting DIG-220 to Control a One-Speed Pump (with optional pump relay installed)

LINE-IN:

- 1. Remove and discard factory "test " wires from terminals 1, 2, and ground.
- 2. Cut Factory AC wires to 5", strip and expose ½" of wire and connect fromerminal #1 to #3, and terminal #2 to #4.
- 3. Supply new AC LINE-IN wires from circuit breaker toTerminals #3 and #4. Ensure proper gauge wire is used to power the pump.

LINE-OUT:

Pump is connected to Terminals #5, #6 and Ground lug.

Connecting DIG-220 to Control a Two-Speed Pump (with optional pump relay installed)

LINE-IN:

Follow the LINE-IN instructions for the above One-Speedinstructions for Two-Speed Pump configuration.

Note: The pump is always powered and will run continuously on low speed when internal time clock program does not have the pumperating on high speed. A safety shut off (wall switch) between the circuit breaker and control be is recommended when the circuit breaker cannot be acessed easily.

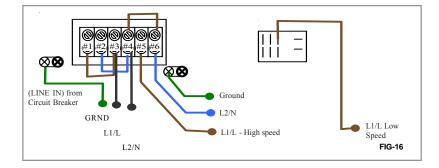

LINE-OUT:

Low Speed Wire

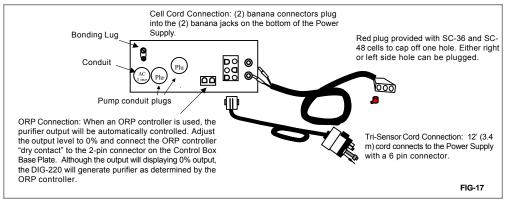

. Remove Factory #6from the Terminal Strip.

Common Wire

- 1. Remove the factory #4 wire from the relay
- Disconnect the other end of the wire from the relay bottom row and reconnect to the relay top row right terminal. Connect the exposed end to the low speed input of the pump.
- 2. Cut the end off and expose 1/2" of wire. Insert this bare end into the #6 terminal
 - which will create a jumper from #4 to #6.

Cell and Tri-Sensor Cord Connections

NOTICEFailure to heed the following may result in equipment damage.Do not energize the orp inputs! The orp connections are dry contact inputs.

PREPARING THE POOL WATER

Installer Please Note:

When properly sized to the site, the DIG-220 will meet the sanitizer "maintenance" requirements of the pool/spa. The DIG-220 is designed to chlorine shock treat, or build up a chlorine residual, when starting with a zero or very low chlorine level.

Before starting the DIG-220, the water must be properly balanced, and the chlorine levenust be adjusted to between 1-to-3 ppm free chlorine. More on adjusting water balance, and start-up chlorine levels, follows below.

Steps to Prepare Water:

- 1. Calculate Pool Volume:
- See next section, below.
- 2. Adjust Water Chemistry:
- (Via saturation index... consider pH, tobl alkalinity, hardness, and water temperature; also adjust sublizer level). See Reference section, page-25 & 26. 3. Add Initial Chlorine Dosage:
- Use liquid chlorine (sodium hypochlorite), or available types of ablet or granular chlorine as obbined from pool supply, to achieve 1-3 ppm free chlorine. 4. Add salt to water (test the water for salt level, first).
- Adjust to 3000 ppm. See salt chart on page-24.
- 5. Enter pool volume Information into DIG-220:
 - See "Pool Volume" programming on page-22.

Calculating Pool Volume:

| Rectangular Round | = Length x Width x Average Depth x 7.5 = Diameter x Diameter x Average Depth x 5.9 | |
|----------------------|--|--|
| Oval | = Length x Width x Average Depth x 5.9 | |
| Rectangular Round | = Length x Width x Average Depth x 1000 = Diameter x Diameter x Average Depth x 785 | |
| | Blameter x Blameter x Werdge Beptil x 700 | |
| val | = Length x Width x Average Depth x 785 | |

Adding Salt:

Type of Salt to Add...

- It is important to use Sodium Chloride (NaCl) salt that is greater than 99% pure.
- Acceptable types of salt include granular food grade, water softener pellets, or solar salt flakes; these are usually available 25-lb (13 kg) to 80-lb (36 kg) bags at local pool
 or building supply outlets.
- Water softener and solar salt will have a slower dissolve rate than food grade salt. Rock salt and Granular Salt with Iodine Rust Preventatives should not be used, as these mixtures contain high levels of impurities and will cause staining.
- Note:

While not recommended, granular salt containing anti-caking additives such asYPS (Yellow Prussiate of Soda) or Sodium Ferrocyanidecan be used. However, these mixtures if not mixed and dissolved immediately— may cause a localized tint to the water or yellow staining of the pool/spa finish.

Determine Amount of Salt Required (and salt level to maintain)...

FIRST... Test the water for current salt content !!!

- The ideal salt range is 3000 3500 PPM (2500 minimum) (2.5 3.5 g/l).
- However, if so desired, the DIG-220 can operate with salt levels in excess of 35,000 PPM (35.0 g/l).
- Salt levels above 6000 PPM are not normally recommended, as corrosion issues may result. Salt levels below 2400 ppm will readuthe efficiency of the DIG-220 and will result in low chlorine production.
- Extremely low salt levels (below 1900 ppm) will activate the low salt safety cut off, and will halt chlorine production ustall is replenished to proper levels.
 Once the DIG-220 is programmed to the pool water volume, the controller will automatically indicate how much salt is required attain ideal salt levels. Additionally, please see the reference table, onpage-24 for information on amount of salt to be added relative to the gallons of water to be treated vs existing salt level.
- see the reference table, onpage-24 for information on amount of salt to be added relative to the gallons of water to be treated vs existing salt level.

Failure to heed the following may result in equipment damage.

Do not use a pool cleaner or vacuum head with wheels, as wheels can leave track marks on newly-plastered pools. Do not allow Granular salt to pile up in one location, without brushing, as staining may occur.

Add Salt to Pool Water...

How to add the salt (or remove it if too much)...

- The object is to have the saltfully dissolve into the water.
- Add salt directly to pool (or spa, if a spa-only installation), and over the main drain (If main drain is present). If there main drain, a vacuum head may be used to encourage salt circulation. Start the water circulation pump and set to run continuously for 24 hours to properly dissolve salt.
- Distributing the salt through brushing is also helpful; brush the salt toward the main drain (if one is present). Set pump option to normal run time after salt has fully dissolved into water.
- If the salt level becomes undesirably high, the only way to remove excess salt is to partially drain the pool/spa and refilltwiresh water.

MENU OVERVIEW ACCESS TO PROGRAMMING

Control Panel:

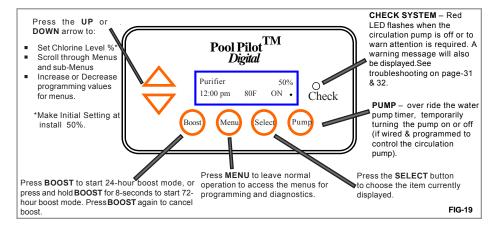

The following instructions apply to software versions 4.40 and above. Earlier versions of software will vary slightly.

The DISPLAY

After 30 minutes of inactivity the display will go to a walking dot screen saver modeAll functions such as chlorine generation, reverse, boost, etc., will continue in the background. Pressing any key will call up the normal informational display

The First line of the display shows the Purifier Output Level in percent (set to 50% at install), or whether the system is in dst or Super-Boost mode. The Second line of the display shows the currentTIME in either 12 or 24-hr mode, the TEMPERATURE in either Fahrenheit or Celsus, whether the cell is powered or not shown as "ON" or "OFF", and Polarity Direction shown as a "." or blank

Operation of Buttons:

Menu Button...

The MENU button is used to leave the normal operation mode and enter the program and diagnostic modes. Use the UP/DOWN arrowed SELECT buttons to navigate through the menus and sub-menus.

MAIN MENU:

- Test Pool Pilot $^{(R)}$ displays various operating parameters and diagnostic results View Setup displays the programmed setup parameters
- Owner Options programs the primary operating parameters an owner would need to change
- Maintenance Menu - tests and programs the primary features a service technician would need to access when servicing the system
- Installer Menu program the initial system setup
- Note: to permit quick access to features, some functions are accessed or programmed in several menus.

Select Button...

The SELECT button chooses the displayed menu option. For thdnstaller Menu, press and hold the SELECT button for approximately 13-seconds to access this feature.

Pump Button...

(This button is not active if the Pump Configuration is programmed for "External Timer" or "Remote runs pump". If the Pump bout is pressed when programmed for one of these modes, "External Time" or "Remote runs pump" will display then revert back to the normal display)

Pump Button - One-Speed Pump Control

The DIG-220 must be wired to control the main circulation pump and programmed for a One-Speed pump for this feature to be active for more information on wiring, see page-15 & 16, and for pump control programming, see page-23). Note - optional pump relay must be installed.

- To turn "PUMP OFF", when pump is on:
 - 1. Press Pump
 - Press V Stop Pump will be displayed. Press 2.
 - "Pump off" will be displayed 3.
- To turn "PUMP OFF FOR SERVICE", when pump is of:

(This mode disables pump operation indefinitely, until manually enabled. Boost and Pump program modes will not enable pump.)

- Press Pump. 1.
- 2. Press V - Stop Pump will be displayed. Press
- 3. "Pump off for service" will be displayed.
- To terminate maintenance mode and return to "PUMPOFF" mode:
 - 1. Press Pump.
 - Press 🛕 End Maint. 2
 - 3. "Pump off" will be in the displayed.
- To turn "PUMP ON", when pump is off:
 - Press Pump. 1.
 - Press A to start pump. 2.
 - 3. The pump will run until the pump program reaches the next scheduled turn off time.

Pump Button Cotinued...

Pump Button - Two-Speed Pump Control

The DIG-220 must be wired to control the two-speed main circulation pump and programmed for a Two-Speed pump for this feature the active (for more information on wiring, see page-15 & 16, and for pump control programming, see page-23). The DIG-220 cannot turn off the pump, and can ordyange pump speeds, between high and low (see "Pump Program 1 and 2" on page-23 for additional information) Note - optional pump relay must be installed.

- To switch to "LOW SPEED" when pump is on high speed:
 - 1. Press Pump.
 - 2. Press V Low Speed.
 - 3. Pump will switch to low speed.
- To switch to "HIGH SPEED" when pump is on low speed:
 - 1. Press Pump.
 - 2. Press \Lambda High Speed.
 - 3. Pump will switch to high speed.

Basic Operational Programming: Adjusting the Purifier Output % ...

Press the UP/DOWN arrow buttons to enter the Purifier Adjustment mode. Adjust the purifier output percentage to the desired qutt: from 0% (off) to 100 % (maximum output); then, press SELECT to default back to the normal display At start up of a new system, the standard output setting starting point is 50%.

Typically, once the initial setting is established, very little adjustment is needed. The purifier % setting refers to the amount of time the cell is energized within a 15-minute cycle. The system cycles on-and-off, as indicated on the display's lower right display... "ON," when generating chlorine. Higher settings will generate more chlorine. Follow the instructions "Purifier % Adjustment Procedure" in the chart on page-19 to determine and correct purifier % settings Example:

50% setting = 50% of 15-minutes or 7.5-minutes ON and 7.5-minutes OFF

25% setting = 3.75-min ON, 11.25-min OFF

Once the percentage is set, the DIG-220 will implement the patented temperature compensation algorithm based on current wateerthperature.

Boost or SuperBoost...

The Boost feature is used to increase the purifier % from its normal setting to 100% for a cumulative 24-hour or 72-hour period/lhen the Boost period expires, or is manually terminated, the Purifier % returns to its previous setting and normal operation.

- Boost Purifier Output to 100% for 24-Hours... From the normal operation mode, press and release the BOOST button. The display will flash Boost 24-hour, "then "Boost hh" (with the "hh" actually being the displayed hours remaining in the boost period).
- Boost Purifier Output to 100% for 72-Hours... From normal operation mode, press and hold the BOOST button until "Boost 72 hour ON" is displayed; then release the BOOST button. Display will then show Boost hh" with the "hh" actually being the displayed hours remaining in boost period.

When Boost is activated, and DIG-220 powered through an external time clock or programmer, the time remaining for the boost decise held in memory; Boost will continue when the pump restarts until the 24 or 72-hr boost period has expired.

If the DIG-220 is controlling the pool pump, the Boost will override the pump program and will run continuously at 100% for text 24 or 72 hours.

To exit Boost or SuperBoost mode and revert to normal operation:

- Allow the Boost cycle to expire.
- OR press BOOST at anytime to manually deactivate Boost.

Purifier Mode

The DIG-220 will automatically display informative messages about the condition of the chlorinator (Purifier Output %, water/toperature, warning messages, etc.), and responds to manual adjustment of purifier % setting (as described below)After 30 minutes of inactivity the display will go to a walking dot screen saver modeAll functions such as chlorine generation, reverse, boost, etc., will continue in the background. Pressing any key will call up the normal informational displ.

Purifier % Adjustment Procedure:

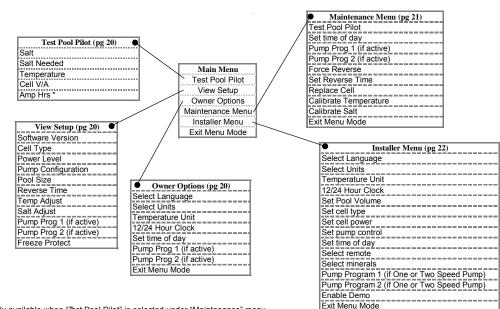

- 1 Balance water chemistry according to necessary water chemistry parameters. (See page-24 & 25.) For new start ups, if free ohine level as tested is not at least 1 ppm, add liquid chlorine to insure a 1 -3 ppm free chlorine reading.
- 2 Add the proper amount of salt as indicated by the DIG-220 (or as described on page-24), and run the circulation pump continus for 24-hours allowing the salt to be fully mixed and dissolved into the pool. If the salt level is too low, the DIG-220 will provide a warning, and will not generate chlorine until the minimum salt level has been reached.
- 3 Use the UP and DOWN arrow buttons to set the purifier % to 50%, and then allow the pool to operate normally

For the first two weeks, test the water chemistry parameters every 3-4 days. Adjust chemicals as needed to maintain correct teabalance. For the Free Chlorine adjustment, use the following table for fine-tuning the controller output percentage (%):

| Purifier % Currently set to: | If Free Chlorine is lower than ideal range | If Free Chlorine is <u>higher</u> than ideal range |
|------------------------------|---|--|
| 0% - 25% | The purifier % output needs to be increased. Use the up arrow button to increase the purifier output %. | The purifier % output needs to be reduced. - If not done already, set purifier % to lower value. - Power level may be too high and may need to be adjusted down. |
| 25% - 100% | The purifier % output needs to be increased. If not done already, set purifier % to higher value. If at 100%, power level may be too low and need to be raised and or cell size increased Check sizing. | The purifier % output needs to be reduced. Use the down arrow button to decrease the purifier output %. FIG-21 |

After the optimal output percentage (%) has been determined, this setting will not normally require further adjustment. Rather compensate for increased bather usage or heavy rainfalls (which can both quickly consume chlorine), select a Boost Cycle.

Menus:

* Only available when "Test Pool Pilot" is selected under "Maintenance" menu.

Test Pool Pilot (Diagnostic Menu):

- Press MENU. 1
- "Test Pool Pilot" is automatically displayed; then press SELECT 2
- 3 The display will automatically toggle through the following displays 🛛 or 🛆 allows manual control forward and back. While in this feature, pressing MENU will override the remaining displays and exit back to normal operation):
 - "Salt =XXXX ppm (X.x g/l)" (The optimum salt level is 3000 ppm (3.0 g/l))
 - = "Add Salt xx Lbs (xx Kg)" (The amount of salt needed to maintain 3000 ppm (3.0 g/l))
 - . "Temperature XX° F (XX° C)" (The temperature of the waterflowing through the Tri-Sensor)
 - "Cell = XX V XX.x A" (The measured voltage and current sent to the SuperCell)
 - "Amp-Hrs = xxxxxx" (The amount of amps received by the SuperCell per hour). This is only viewable if "Test Pool Pilot was selected under the "Mantenance Menu.'
- The controller will automatically leave the menu and revert to normal operation.

View Setup (Program and parameter menu to view the current programmed settings):

- Press MENU, press ∇ or Λ until "View Setup" is displayed, then press SELECT 1.
- 2 The display will automatically toggle through the following displays (or pressin abla or abla allows manual control forward and back. While in this feature, pressing MENU will override the remaining displays and exit back to normal operation):
 - "Software VX.Xx" (The version number of Digital #DIG-200 software)
 - "Cell = XX-XX" (cell type: SC-36, SC-48, SC-60, CC-15)
 - "Power Level" (1-lowest, 2, and 3-highest; factory setting is 2)
 - Pump Configuration (External Timer, one-speed pump, two-speed pump, or remote runs pump. Factory setting is External Timer.)
 - "XX,XXX gallons(liters)" (The pool volume programmed in Installation Menu; 15,000 is the factory setting; page-22)
 - "Reverse = X hrs" (The reverse rate programmed in Installation Menu: 4-hrs is factory setting)
 - "Temp. adjust = X" (The temperature adjustment variation of actual tri-sensor reading; page-22)
 - "Salt adjust ± X %" (The salt calibration adjustment variation of actual tri-sensor reading; page-22)
 - "Pump program 1" (Only appears if pump control has been set to one-speed or two-speed)
 - "Pump program 2" (Only appears if pump control has been set to two-speed or two-speed)
 - Freeze protect (can only be enabled when the pump control is set to one-speed pump mode)
- 3. The DIG-220 will automatically leave the menu and revert to normal operation.

Owner Options:

- 2. Press ∇ or Λ for desired selections, followed by SELECT
- 3. Once all modifications are complete, press 👽 or 🛕 until "Exit Menu Mode" is displayed; then press SELECT The menu will also time out afer 20 seconds of no key activity

Select Language:

(Allows for personal preference language display)

- Press V or A until "Select Language" is displayed; then press SELECT English is the factory setting).
- Press ∇ or Λ until desired language "English," "Espanol," "Italiano", or "Francais," is displayed; then press SELECT

Continued Next Page ...

Owner Options Continued:

Select Units:

(Used to program the operator's personal preferences for the liquid and weight measurement the DIG-220 will display)

- 1. Press **∇** or **∆** until "Select Units" is displayed; then press SELECT ("English Units" is the factory setting).
- 2 Press 👽 or 🛕 until desired measurement "English Units" (gallons and pounds), or "Metric Units" (liters and kilograms), is displayed; then press SELECT

Temperature Units:

(Used to set the personal preference (C or F) for temperature display

- 1. Press ∇ or Λ until "Temperature Unit" is displayed; then press SELECT("Fahrenheit" is the factory setting).
- 2. Press ∇ or Λ until desired measurement unit *"Fahrenheit*" or *"Celsius"* is displayed; then press SELECT

12/24 Hour Clock:

(Allows for personal preference time clock display)

- 1. Press **∇** or **∆** until "12/24 hour clock" is displayed; then press SELECT (12 hour clock is the factory setting).
- 2. Press ∇ or Λ until the desired clock format (12-hour or 24-hour clock) is displayed, then press SELECT

Set Time of Day:

- (Allows for changes to the time of day displays for time zones or day-light savings.)
- 1. Press ∇ or Λ until desired hours are displayed; then press SELECT
- 2. Press ∇ or Λ until the desired minutes are displayed; then press SELECT

Exit Menu Mode:

Press SELECT to exit menu entry.

Maintenance Menu:

- Press MENU, press **V** or **A** until "Maintenance Menu" is displayed; then press SELECT
- Press ∇ or Λ for desired selections, followed by SELECT
- Once all modifications are complete, press 👽 or \Lambda until "Exit Menu Mode" is displayed; then press SELECT The menu will also time out afer 20 seconds of no key activity

Test Pool Pilot:

(Diagnostic Menu)

The display will automatically toggle through the following displays ∇ or Δ allows manual control forward and back. While in this feature, pressing MENU will override the remaining displays and exit back to normal operation):

- "Salt =XXXX ppm (X.x g/l)" (The optimum salt level is 3000 ppm (3.0 g/l))
- "Add Salt xx Lbs (xx Kg)" (The amount of salt needed to maintain 3000 ppm (3.0 g/l)) "Temperature XX° F (XX° C)" (The temperature of the waterflowing through the Tri-Sensor)
- "Temperature XX° F (XX° C)" (The temperature of the waterflowing through the Tri-Sensor "Cell = XX V XX.x A" (The measured voltage and current sent to the SuperCell)
- "Amp-Hrs = xxxxx" (The amount of current times hours of operation received by the SuperCell) This is only viewable if "Bst Pool Pilot was selected under the "Maintenance Menu."

Set Time of Day:

(Allows for changes to the time of day displays for time zones or day-light savings.)

- 1. Press ∇ or Λ until desired hours are displayed; then press SELECT
- 2. Press ∇ or Λ until the desired minutes are displayed; then press SELECT

Force Reverse:

<u>Note</u>: this is a diagnostic tool, only and should <u>not</u> be used unless a problem is suspected.

(This function activates a reverse cycle, which can be used to verify that the self-cleaning feature is working). After selence "Force Reverse," there will be a 40 second delay before proceeding. During the delay "Cell reversing *" will display

- 1. Press ∇ or Λ until "Force Reverse" is displayed; then press SELECT
- 3. "Cell reversing" will display temporarily for 40-seconds.
- The "." (period) on the end of 2^d line of the display will either appear, or disappear—based on its previous state—to indicate cell power polarity has reversed.

Set Reverse Time:

(Used to program the SuperCell's self-cleaning cycle.)

Failure to heed the following may result in equipment damage.

Reduced polarity reversing cycle times will reduce SuperCell life, and should <u>only</u> be used due to uncontrollable scale formation on the Cell.

<u>ALWAYS</u> test and adjust water balance,<u>before</u> attempting scale control via shortening reverse period.

- 1. Press ∇ or Δ until "Set Reverse Time" is displayed; then press SELECT (4-hours is the factory setting).
- 2. Press ∇ or Λ until the desired cycle time (2, 4, 8, or 16 hours) is displayed; then press SELECT

Replace Cell:

(Used to reset the ampere-hour counter after a cell is replaced) Press and hold for aproximately 13 seconds until display briefly shows "Amp-Hrs = 0".

Calibrating Temperature:

(Used only when it is desired to match the display of the Digital to another on-site thermometer.)

Note: Temperature can only be calibrated 2-minutes afer start-up.

- 1. Press ∇ or Λ until "Calibrate Temp." is displayed; then press SELECT
- 2. Press ∇ or A to adjust temperature up or down to the desired temperature; then press SELECThe maximum adjustment is ± 6 F (± 3 ° C). (To maximize protection, only negative adjustments will be used to calculate freeze protection temperature.)

Calibrating Salt:

Note: This step is used to match the Digital to the installed Tri-Sensor. In the event the salt display does not match on-stest results, follow these steps (it is necessary to wait 2-minutes after start-up before calibrating salt):

- 1. Press ∇ or Λ until "Calibrate Salt" is displayed; then press SELECT
- 2. Press ∇ or Λ until the number on the display matches the accurately measured pool sample; then press SELECThe maximum adjustment is ± 1000 ppm (1.0 g/l).

Exit Menu Mode:

Press SELECT to exit menu entry

Programming at Installation

NOTE: Once determined to be appropriately programmed for the installation site, the following menu items should not require retar access; rather, need to access should be infrequent or not at all. See "Basic Operational Programming," for setting initial Purifier Level and routine control instruions (page-19).

The DIG-220 requires the pool volume be entered into the microprocessor for control center to automatically indicate how manyopinds (kgs) of salt to add should salt levels fall. For instructions in calculating volume, see Calculating Pool Volume on page-17.

The salt chart on page-24 can also be used to calculate how much salt, in pounds (kgs), should be added to reach the recommendeevel of 3000 ppm (3.0 g/l) salinity Adjust Purifier Output to 50%... see page-19 for instructions.

Installer Menu:

- Press MENU, press **V** or **A** until "Installer Menu" is displayed
- Press and hold the SELECT button for approximately 13-seconds.
- Press ∇ or Λ for desired selections, followed by SELECT
- Once all modifications are complete, press ∇ or Δ until "*Exit Menu Mode*" is displayed; then press SELECT Please note the menu will time out after 20 seconds of no key activity and any changes may be lost.

To enter the **Installer Menu**, press and hold SELECT button for approximately 13-seconds.

Select Language:

- (Allows for personal preference language display)
- 1. Press **∇** or **∆** until "Select Language" is displayed; then press SELECT *English* is the factory setting).
- 2. Press ∇ or Λ until desired language "English," "Espanol," "Italiano", or "Francais," is displayed; then press SELECT

Select Units:

(Used to program the operator's personal preferences for the liquidand weights measurement the DIG-220 will display.)

- 1. Press **∇** or **∆** until "Select Units" is displayed; then press SELECT (*English Units*" is the factory setting).
- 2. Press ∇ or Λ until desired measurement "English Units" (gallons and pounds), or "Metric Units" (liters and kilograms), is displayed; then press SELECT

Temperature Units:

(Used to set the personal preference (C or F) for temperature display

- 1. Press **∇** or **∆** until "*Temperature Unit*" is displayed; then press SELECT("*Fahrenheit*" is the factory setting).
- 2. Press ∇ or Λ until desired measurement unit "Fahrenheit" or "Celsius" is displayed; then press SELECT

12/24 Hour Clock:

- 1. Press 👽 or 🛕 until "12/24 hour clock" is displayed; then press SELECT (12 hour clock is the factory setting).
- 2. Press ∇ or Λ until the desired clock format (12-hour or 24-hour clock) is displayed, then press SELECT

Pool Volume:

- (Must be programmed for the "salt amount needed" display to be accurate.)
- 1. Press **∇** or **∆** until "Set Pool Volume" is displayed; then press SELECT
- (Factory setting is 15,000 gallons). (The range is 500 to 127,500 gallons (1,000 to 226,000 liters)
- 3. Press ∇ or Δ until correct pool size is displayed; then press SELECT

Cell Type:

(Must match the installed cell)

- 1. Press **∇** or **∧** until "Set Cell Type" is displayed; then press SELECT(SC-48 is the factory setting).
- 2. Press **∇** or **∆** until the desired cell type (SC-36, SC-48, SC-60, or CC-15) is displayed, then press SELECT

Cell Power:

- (See recommendations on pg 31 for when to change cell power. Factory setting is cell power 2)
- 1. Press **∇** or **∆** until "Set cell power" is displayed; then press SELECT (Power level 1 is the factory setting).
- 2. Press **∇** or **∧** until the desired power level (1,2, or 3) is displayed; the press SELECT

Pump Control:

- (Program DIG-220 to accept a one-speed pump, two-speed pump, remote, or external timer) Note optional pump relay must be instead
- 1. Press ∇ or Λ until "Set Pump Control" is displayed; then press SELECT (external timer is the factory setting).
- 2. Press 👽 or 🛕 until the desired pump configuration (One-speed pump, two-speed pump, remote runs pump or external timer) is displayed; then extra SELECT.

Set Time of Day:

- (Allows for changes to the time of day displays for time zones or day-light savings.)
- 1. Press ∇ or Δ until desired hours are displayed; then press SELECT
- 2. Press ∇ or Λ until the desired minutes are displayed; then press SELECT

Select Remote:

(Selects type of external controller. Need Pump control programmed for "remote runs pump" inorder to use this option.)

- 1. Press **∇** or **∆** until "Select remote" is displayed, then press SELECT (Remote 1).
- 2. Press ∇ or Λ until the desired remote (1 or 2) is displayed, then press SELEC.T

Select Minerals:

(This is a special display mode, which does not impact salt readings or other functionality)

- 1. Press ∇ or Λ until "Select minerals" is displayed, then press SELECT (Salt).
- 2. Press ∇ or Λ until the desired display mode (Salt or Minerals) is displayed; then press SELECT

Pump Program 1 and 2:

Note: The pump programs are only accessible if a one or two speed pump is selected in the pump configuration) There are two grams available for high speed operation. Low speed operation is not programmable and pump will run continuously on low speed unless pump program is calling for high speed. A separate switch is recommended to turn off low speed pump operation when servicing system)

- 1. Press ∇ or Λ until "Pump program X" is displayed; then press SELECT
- 2 Press ▲ to program the pump, press D to Delete the program or SELECT to exit with no change.
- If ∇ is selected, use ∇ or Λ to select hours, then SELECT Repeat for minutes.

Enable Demo:

(This is a special display mode, which does not impact salt readings or temperature readings. Note that chlorine will not be reperated even though valid readings for volts and mps will show on the "Test Pool Pilot" menu.)

- 1. Press MENU; press ∇ or Δ until "Installer Menu" is displayed; then press SELECT
- 2. To disable demo mode, press ∇ or Λ until "Disable demo" is displayed, then press SELECTUnit will reset and operate in normal mode.
- 3. To enable demo mode, press ♥ or ▲ until "Enable demo" is displayed, then press SELECT *** DEMO *** will flash, then DIG-220 will reset into demo mode.

Exit Menu Mode

Press SELECT to exit menu entry

END OF PROGRAMMING SECTION

REFERENCE SECTION

Salt Addition Chart:

The following salt chart is included for reference only; once programmed to the correct water volume, the controller will autartically indicate how much salt is required to achieve optimum water salinity.

| optimu | im water salinity. | - | Pounds (kilograms) of Salt needed to attain 3000 ppm (3.0 g/l) | | | | | | | | | |
|---------|--|---------------------------|--|---------------|----------|----------|----------------|------------------|----------|------------------|------------------|-------------------|

| | | | (If lower salt level is desired, partially drain and refill with fresh water.) | | | | | | | | | |

Basic Water Chemistry: The DIG-220 is designed to produce chlorine on a daily basisTo monitor the system's efficiency, the water chemistry ranges, and schedule of periodic checks—per below—should be followed.

| | Failure to heed the following may result in equipment damage. | | | | |
|--------|---|--|--|--|--|
| NOTICE | Excessively high chlorine levels can cause premature cell failure and corro sion damage to pool fixtures and equipment. | | | | |
| | | | | | |
| | Failure to heed the following may result in equipment damage. | | | | |
| NOTICE | Always follow the instructions on the manufacturer's label whenever handling or using chemicals. | | | | |
| | Failure to heed the following may result in equipment damage. | | | | |
| NOTICE | Do not use a hydrogen peroxide based chlorine neutralizer or permanent dam- age to the cell will occur | | | | |

REFERENCE SECTION

Basic Water Chemistry Continued:

| CHEMICAL | IDEAL RANGE | IDEAL TEST SCHEDULE | EFFECT OF LOW/HIGH LEVELS | CORRECTIVE ACTIONS |
|------------------------------|------------------------------|------------------------|--|---|
| Free Chlorine | 1 to 3 ppm | Weekly | Low free chlorine: Not enough residual chlorine to safely sanitize pool water. High free chlorine: Corrosive to metallic fixtures in pool water. Can bleach swimwear and hair. | Low free chlorine: Check for combined chlorine level and shock as necessary. Increase purifier output to maintain a 1-3 ppm residual reading. <u>High free chlorine:</u> Decrease purifier output. Let chlorine dissipate normally until 1-3 ppm is achieved. In extreme cases, pool water can be diluted with fresh water or a chlorine neutralizer added. (Diluting will reduce salt and CYA. Check and adjust as needed.) |
| Ph | 7.2 to 7.8 ppm | Weekly | Low pH: (acidic) Equipment corrosion, eye/skin irritation, plaster etching, rapid chlorine consumption. <u>High pH:</u> (basic) Scale formation, cloudy water, eye/skin irritation, poor chlorine effectiveness | Low pH: Add sodium carbonate or soda ash High pH: Add muriatic acid or sodium bisulfate. |
| Total Alkalinity | 80 to 100 ppm | Monthly | Low TA: Eye irritation, pH "bounce", stained/etched plaster and metal corrosion. <u>High TA:</u> Constant acid demand, difficulty in maintaining pH, and contributes to scale formation or cloudy water conditions. | Low TA: Add sodium bicarbonate. High TA: Add muriatic acid often, a little at a time (may take a week or more to lower the TA). |
| Salt | 3000 to 3500 ppm | Monthly | Low Salt: Below 2,500 ppm causes premature cell failure and reduces chlorine production <u>High Salt:</u> Above 6,000 ppm can cause corrosion of metallic fixtures and will taste salty. Note: DIG-220 can safely operate with salt levels up to 35,000. | Low Salt: Add salt according to digital display on Pool Pilot unit or salt chart. <u>High Salt:</u> If undesirably high, partially drain and refill the pool with fresh water. (Diluting will reduce CYA. Check and adjust as needed.) |
| Calcium Hardness | 200 to 400 ppm | Monthly | Low CH: Etching of plaster, equipment corrosion <u>High CH:</u> Scale formation, cloudy water. Rapid buildup of scale may exceed the system's self-cleaning capability and require manual cleaning of the SuperCell. | Low CH: Add calcium chloride flakes. <u>High CH:</u> Partially drain and refill pool with fresh water to dilute. (Diluting will reduce salt and CYA. Check and adjust as needed.) Please note – in some areas there may be higher than recommended calcium levels in the tap water. If this level is seen, call the factory for advice on this condition. |
| Acid (CYA) - Stabilizer - | 60 to 80 ppm 30 to 50 ppm | Monthly | Low CYA: destruction of chlorine by the UV rays from the sun. <u>High CYA:</u> Requires more chlorine to maintain proper sanitizer levels. Note: CYA not needed for indoor or bromine pool. CYA can be reduced to 30 - 50 ppm for DIG-220 in colder climate regions. | Low CYA: Add cyanuric acid(1 lb/5000 gallons increases CYA 25 ppm) <u>High CYA</u> : Partially drain and refill pool with fresh water to dilute. (Diluting will reduce salt. Check and adjust as needed.) |

Using the Saturation Index (SI):

The Saturation Index is a formula used to predict the calcium carbonate saturation of water, that is, whether your water will private, dissolve, or be in equilibrium with calcium carbonate.

Water is properly balanced if the SI is 0 ± 0.3. If SI is greater than 0.3, scaling and staining will occur. If SI is less than3, then the water is corrosive to metallic fixtures and aggressive to plaster surfaces and vinyl liners.

A high or low SI can cause premature damage to the cell, equipment or pool finish. As a general rule, higher concentrations afficium, total dissolved solids, pH, and alkalinity all promote a greater tendency for scale. Scaling potential also increases with increasing temperature.

Use the chart below to determine your overall water balanceTest water for pH, water temperature, Calcium Hardness,Total Alkalinity, Salt Level, and use the equivalent Factors (TF, CF, AF, Constant) from the chart below to determine your Saturation Index Adjust chemicals to maintain balanced water.

| | | | | | pH + TF | + CF 4 | AF- | SC = SI | | | | | | |
|--|-------|----------|-----|---|---------------------|--------|-----|---------------------|-----|----|-----|---------------|--------|----------------------------|
| | Tem | perature | TF | | Calcium Hardness | CF | | Total Alkalinity | AF | | s | alt Level | SC | |
| | 60 F | 15.6C | 0.4 | | 150 ppm | 1.8 | | 75 ppm | 1.9 | | | 0 - 1000 ppr | n 12.1 | |

REFERENCE SECTION

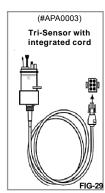

Using the Saturation Index (SI) Continued:

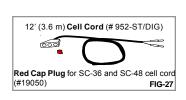

Examples:

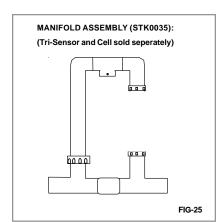

| pH = 7.4: | Water Test Results #1 pH = 7.4 | |
|-----------------------------|-----------------------------------|---|
| Water Temperature = 84 F | TF = 0.7 | |
| Calcium Hardness = 400 ppm: | CF = 2.2 | 7.4 + 0.7 + 2.2 + 2.1 – 12.4 = 0 (Water is perfectly |
| Total Alkalinity = 125 ppm | AF = 2.1 | balanced) |
| Salt Level = 3200 ppm | SC = 12.4 | |
| | Water Test Results #2 | |
| pH = 7.8 | pH = 7.8 | |
| Water Temperature = 84 F | TF = 0.7 | |
| Calcium Hardness = 600 ppm: | CF = 2.4 | 7.8 + 0.7 + 2.4 + 2.3 - 12.4 = 0.8 (Water is scale forming) |
| Total Alkalinity = 200 ppm | AF = 2.3 | |
| Salt Level = 3200 ppm | SC = 12.4 | (FIG-24) |

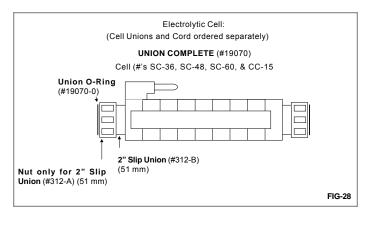

Part Numbers:

Fuse Location and Ratings:

Failure to heed the following may result in permanent injury or death.

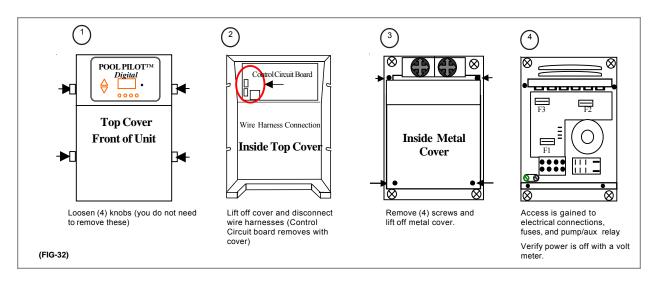

ELECTRICAL SHOCK HAZARD... Turn off the electrical power to DIG-220 before servicing.

To inspect or service fuse, disconnect power and remove power center cover (see below for location of fuse)s required, see pages-14 & 15 of this manual for information on converting the DIG-220 from a 230-Vac to 115-Vac input power supply.

| Incoming Voltage | Location | Fuse | Description |
|------------------|----------|-----------------|--------------------|
| 230V | F1 | 3 Amps 250 Vac | Main AC Power Fuse |
| 230V | F2 | 3 Amps 250 Vac | |
| 230V | F3 | 20 Amps 250 Vac | Cell Fuse |
| 115V | F1 | 6 Amps 250 Vac | Main AC Power Fuse |
| 115V | F2 | 3 Amps 250 Vac | Control Panel |
| 115V | F3 | 20 Amps 250 Vac | Cell Fuse |
| | | | (FIG-31) |

There are very few serviceable parts on the DIG-220 except the fuses. For any other problems with the Control Box, please caot the Factory or Authorized Dealer/Service Center. To remove the Control Box Cover and access the fuses, follow these step

DANGER: TURN OFF THE POWER FROM THE CIRCUIT BREAKER BEFORE SERVICING THIS UNIT.

Removing\Inspecting\Cleaning the Tri-Sensor (Pump must be off):

Note: the Tri-Sensor does not normally require maintenance or cleaning. Unnecessary cleaning will decrease the life of the cell

| • | Failure to heed the following may result in permanent injury or death. |
|--------|--|
| | Turn off the pump power at the circuit breaker before servicing this unit. Persona injury or equipment damage could occur if the pump activates. |
| | Failure to heed the following may result in equipment damage. |
| NOTICE | If the manifold is located below the water level, be sure to block the flow from both the pool input and output <u>before</u> removing the manifold, tri-sensor, or electrolytic cell. |
| | Failure to heed the following may result in equipment damage. |
| NOTICE | The Tri-Sensor should <u>not</u> be pulled out at an angle, or the flow paddle or flow post may be damaged. |

Continued Next Page...

Removing\Inspecting\Cleaning the Tri-Sensor Continued (Pump must be off):

Failure to heed the following may result in permanent injury or death.

CHEMICAL HAZARD... To avoid damaging splashes, always add acid to water never water to acid. Wear safety glasses and use other appropriate personal protection equipment.

- 1. Disconnect the Tri-Sensor cable from the power center (Place the end of the cable out of the waywhere it will stay dry when the Tri-Sensor is removed.) Please note all cautions and warnings!
- 2. Remove the two (2) screws retaining the Tri-Sensor in the Tee joint of the Manifold.
- 3. Note the orientation of the Directional of FlowTab. The Tri-Sensor must be installed in the same orientation when it is reistalled or replaced.
- 4. The Tri-Sensor can now be pulled out of theTee. Firmly grip the Tri-Sensor assembly (this is typically done with a large pir of channel lock pliers). Twist the Tri-Sensor backand-forth while simultaneously pulling theTri-Sensor straight out of the Tee joint.
- Inspect the following on the flow switch: Verify the thin metallic paddle is straight and free from erosion; verify the loptastic post is straight and free of cracks. Do not twist or bend the paddle or the plastic post. (see fig 30 on page-26 for illustration of Tri-Sensor flow paddle.)
 Inspect the two salt sensor blades. The blades should not have any mineral deposits (scale) or other debris on them. If the desides need to be cleaned, use the following method:
- Inspect the two salt sensor blades. The blades should not have any mineral deposits (scale) or other debris on them. If the desides need to be cleaned, use the following method:

 Do not use any metallic objects to scrape the blade surfaces or you will remove or damage the blade sensor coating.
 - To remove a calcium scale buildup, mix one (1) art Muriatic Acid into four (4) parts water. Mix the solution in a small container tall enough to cover the sensor blades. Always add acid to water, never water to acid, see warnings above.
 - Immerse the salt sensor blades in the solution for up to 15-minutes. An effervescing action indicates the calcium is being sideved from the blades.
 - Rinse with fresh water and reinspect. Repeat the acid treatment as necessary until all scale has been eliminated. Use care rtotallow the pin connection to get wet.
- 7. Check the tri-sensor assembly for any damage to the plastic housing and replace if needed.

Testing the Flow Switch, Cleaning the Filter Screen, Cleaning the Bypass Valve

The flow switch is a critical equipment protection device. When water flow has stopped, to prevent damage to the cell or system is important power to the SuperCell be automatically turned OFF. It is important to verify the proper operation of theTri-Sensor's water Flow Switch protection device.

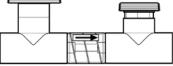

DO NOT operate system with a faulty flow switch.

NOTICE

Failure to heed the following may result in equipment damage.

The following procedure can be used to verify the proper operation of the flow switch, or to flush debris from the Bages Valve

- 1. Turn off circulator pump.
- Slightly loosen the union nut just below the cell on the side of the manifold that does not contain the filter screen.
- 3. Completely loosen the manifold union nut that contains the filter screen and pivot the manifold to gain access to the filter screen.
- 4. Remove the screen. Clean the screen if dirty
- If the screen was dirty then the system may need to be purged to remove excess debris. Leave the manifold off and run the pump for a few seconds until clear.
- 6. Wrap the strainer screen securely with a small piece of plastic wrap (saran wrap, food wrap or zip lock bag) as indicated in the diagram, place it back in the union.
- 7. Hand tighten the two unions that were loosened.
- Turn on the pump and the DIG-220. The plastic will stop water flow to the flow switch, which is part
 of the Tri-Sensor that is located in the upper portion of the manifold. All water will be forced through
 the Bypass Valve. This action will normally flush out any small bit of debris trapped in the Bypass
 Valve.)
- STRAINERSCREEN SHOWN TEMPORALLY WRAPPED IN PLASTIC

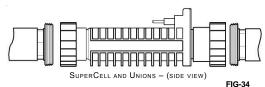

- The DIG-220 should detect a low water flow at the Tri-Sensor, and activate the red Check System LED. The DIG-220 will also display the message "Purifier Off! Check Flow."
- If the DIG-220 will also display the message "Purifier Off! Check Flow."
 FIG-33
 If the DIG-220 did not display this warning, then check the Tri-Sensor cable connections and inspect the Tri-Sensor as doted in the previous section. If the warning message still does not appear, then turn the DIG-220 bif and contact the factory or your local dealer for assistance.
- 11. Turn the pump off.
- 12. Loosen the unions.
- Remove the plastic wrap and replace the strainer screen. Hand tighten unions.
 Resume normal operation.

Servicing the SuperCell

The SuperCell may require removal for periodic visual inspections, or for servicing when debris or calcium mineral deposits delop. The need to inspect and service the cell is indicated by the following display messages: "Check System" light, and the message, "Check/Clean Cell", or "Purifier Off - Cole Flow".

The SuperCell is installed with Unions on each end to allow quick and easy installation and removal.

- 1. Turn off pump and shut off all power.
- Detach the SuperCell cable from the SuperCell.
 Unscrew the unions at both ends of the SuperCell.
- Slide the SuperCell out of the ManifoldAssembly.

Continued Next Page...

Servicing the SuperCell (Continued)

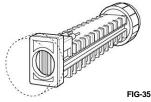

Visual Inspection of the SuperCell...

Remove the SuperCell from the ManifoldAssembly, following the directions in the previous section. The SuperCell titanium blades, seen inside the cell body should be straight and clear of any debris on the ends or between the blades.

A white flaky or crusty calcium build up on the edge or between the blades will shorten the life of the cell.

Clean the cell immediately, and determine the cause of scaling. See "Basic Water Chemistry," and "Using the Saturation Index" ... on page-24, 25, & 26. Also see "Manual Cleaning of the SuperCell" ... starting on this page. Your *DIG-220* is designed to automatically self-clean calcium scale build up that may form on the blades during normal operation. However, unbalanced water chemistry can cause a heavy scale build up exceeding self-cleaning capabilities... thus; periodic manual cleaning may be necessaryThe simplest way to avoid this extra work is to maintain the water chemistry at the levels recommended.

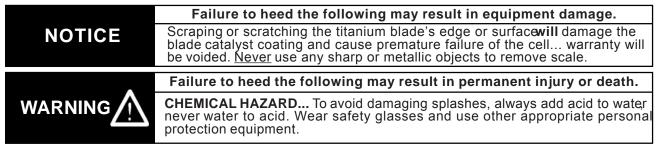

Failure to heed the following may result in equipment damage.

For maximum cell life, maintain water in a balanced condition. Water maintained in a scaling condition will shorten cell life and may render the chlorinator inoperative. Damage and/or service calls, caused by improper water balance, will NOT be covered under the equipment warranty

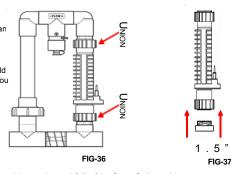

Manual Cleaning of the SuperCell...

NOTICE

The SuperCell should only be cleaned when excessive calcium buildup is present. Unnecessary cleaning will reduce the life of dtell.

- 1. Turn off circulator pump.
- 2. Loosen the unions as indicated on the cell manifold.
- 3. Remove the cell and place a cap or plug on the end of the cell as shown. Plugs are available at an
- pool supply warehouse or home improvement store. Ask for a 1.5" MPT clean out plug.
- 4. Fill the capped cell with water 2-inches from the top of the cell blades.
- Fill the rest of the cell with Muriatic Acid. This allows for an approximate 1-to-4 solution. Always add the acid to the water. If you do it the other way around, it can cause the solution to spray back at you causing serious injury.
- 6. Allow the solution to sit in the cell for up to 20-minutes.
- 7. Safely dispose of the solution; pouring it into the pool is recommended.

Installing a SuperCell...

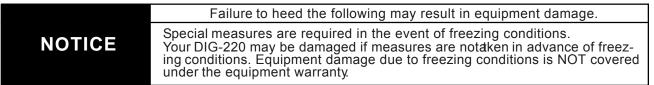

- 1. Clean and dry the electrical terminals on the SuperCell. The contacts must be completely dry to avoid corrosion and failuré the SuperCell or cable.
- Insure the union o-rings are firmly in place; then place the SuperCell into the manifold with the cell oriented as illustrated the diagram on page-12.
- 3. Tighten the unions <u>by hand</u> for a watertight seal.
- 4. The SC-36 and SC-48 SuperCell will have two (2) electrical terminals. The SC-60 and CC-15 will have three terminals
- Connect the SuperCell plug cord so two (2) open holes align with any two mating terminals and push gentbut firmly, to connect. if using a SC-36 or SC-48 Cell, use the red weather plug to seal the unused contact in the cable.
- 6. Turn on the system.
- 7. Check for leaks and proper operation of the chlorinator.

Important

Information Critical to the Survival of Your Chlorinator

Winterizing

In areas that experience severe cold weather, or extended periods of freezing temperatures, the DIG-220 should be winterized by aning all water from the Manifold Assembly (SuperCell and Tri-Sensor), pump, filter, supply and return lines prior to freezing weather, the Digital Manifold (including & SuperCell and Tri-Sensor) will be damaged by freezing water. The DIG-220 power supply is not affected by the cold and does not need to be removed.

Freeze protection program and its limits

When configured to control the circulation pump, the DIG-220 can reduce the possibility of freeze damage to the filter and pipen milder climates where freezing weather is not normally expected. Winterizing procedures should be done prior to periods of freezing temperatures.

The DIG-220 will turn on the pump and circulate pool water while the water temperature is below 40°F (4.4°C). Circulating theol water will reduce the possibility of damage to the filter and pipes due to freezing.

The DIG-220 freeze protect feature will NOT work properly unless all of the following conditions are met:

- The DIG-220 must be powered continuously An external switch or timer should not be used to turn of the DIG-220 power during the freezing weather.
- The DIG-220 must control the power to the circulation pump.
- The DIG-220 "Pump Control" must be programmed for One-speed pump (see pg. 34). When the Tri-Sensor indicates that water tempeture is below 38°F (4.4°C), the Control Unit will override the normal timed program cycle and run the pump 30 minutes minimum or continuously while the water temperature below 38°F (4.4°C).
- The DIG-220 uses a temperature sensor located in the Tri-Sensor to determine water temperature. If the Tri-Sensor is located that it cannot accurately detect the cold water, then the freeze protection becomes ineffective. (For example, if the Tri-Sensor is located inside a protected or warm locatiand the other pool components are located in an unprotected area, the other pool components could freeze before the Tri-Sensor detects the cold water.)

Spring Start-Up

It is recommended the water be manually chlorine-shocked when first starting up the pool in the springtim Test water, and add the appropriate chemicals to balance the pool water per the levels recommended on page-24 & 25.

Be sure to check salt and cyanuric acid (stabilizer), bringing those readings up to the recommended levels. It is also a goode to inspect the cell, manifold screen, and test the Tri-Sensor flow switch; clean and/or replace those items as necessary

TROUBLESHOOTING

| Issu | ie / Message Displayed | Problem | Typical Solution | | |
|--------|--|--|---|--|--|
| 1) | Insufficient Purifier | The test kit reagents or test strips are old or expired. | Retest with new Reagents or Strips. | | |
| | Production. | The DIG-220 is set too low in relation to purifier demand. | Increase the Purifier % output. | | |
| | | The circulation run time is insufficient. | Increase your pump run time. | | |
| | | The bather load has increased. | Increase the Purifier % output or add a Non-Chlorine Shock containing PotassiumMonopersulfate tosupplement. | | |
| | | The body of water being purified leaks. | Repair the leak and rebalance as needed. | | |
| | | Low Salt. | Check the residual salt level and adjust as needed. | | |
| | | "Cell Type" selection not matched to the cell installed. | Follow the INSTALLER SETUP instructions, see page 23. | | |
| | | Purifier loss due to intense sunlight. | Check your stabilizer level and adjust if needed. | | |
| | | If the output is 100% then "Cell Power" may be inadequate. | Follow programming directions on page 23 to increase the polevel. | | |
| 2) | Scale Buildup within the Cell. | The water being purified contains high pH, total alkalinity and calcium hardness levels. (Cell scales within 2 – 3 weeks) | Calculate Saturation Index to assure balanced water. Ad chemicals and clean the cell. See page-24 & 25 and page- 29. | | |
| | | Power Supply not reversing polarity (Cell constantly scales within 3 – 5 days) | Contact the factory for Warranty Status/Procedures. | | |
| 3) | DC Plug and Cell Terminals Burned. | The Cell terminals are wet due to an incorrectly oriented (upside down) cell, failure to dry terminals, or leaking cell body | Make sure cell is installed correctly See page- 29. Contact factory for Warranty Status/Procedures. | | |
| | | The Cell plug is not securely pushed onto the cell terminals, causing electrical arcing in the cell cord terminals. | Ensure the Cell cord plug is pressed completely onto the terminal. Check the terminals and clean with a dry cloth to rer all dirt and corrosion. If the cell cord is corroded or burned it must be replaced to prevent damage to the cell. | | |
| Failur | Premature Cell Failure (Requires | Abnormally high Cell usage due to an insufficient Stabilizer (Cyanuric acid) level. | Check the stabilizer level and adjust to recommended levels. | | |
| | Replacement Cell). | Excessive Scale/Debris in the Cell. | See Section 2 above. | | |
| | | "Cell Type" selection not matched to the Cell installed. | Follow the INSTALLER SETUP instructions, see page-29. | | |
| 5) | White Flakes in the Water. | This occurs when excessive calcium hardness is present. Usually due to water chemistry visually inspect and if necessary clean the cell as described and t | | | |
| 6) | No Power to the | Circuit Breaker tripped. | Check the power going to the Control Box. Reset the Circuit Bre | | |
| | Control Box. | Internal Power Fuse blown. | Check and replace fuse. See page-27. | | |
| 7) | CHECK SYSTEM Light Flashing. | Insufficient Flow (Min 15 gpm) (3.4 m³/hr) | Ensure your Filter and Cell are clean of debris. Check all va that might divert flow away from the cell. | | |
| | Message Displayed "PURIFIER OFF - CHECK | Tri-Sensor Defective. | Contact the factory for Warranty Status/Procedures. | | |
| | FLOW" (No purifier generation during this display) | Tri-Sensor Cord Defective. | Contact the factory for Warranty Status/Procedures. | | |
| 8) | CHECK SYSTEM Light Flashing. Message Displayed "CHECK/CLEAN CELL" (Purifier still producing) | Extremely Low Cell Amperage. Select "Test Pool Pilot" menu and note cell volts and amps. | Same as LOW SALT message below. | | |
| 9) | CHECK SYSTEM Light Flashing. | Low Cell Amperage. | Cell heavily scaled. If cell is already clean, replace cell. | | |
| | Message Displayed "LOW AMPS – CELL" | Pool has low salt and the unit needs salt calibration. | Add salt to pool, recalibrate salt sensor. | | |
| | (Purifier still producing) | The Cell Cord is Loose. | Ensure that the cord is firmly pressed into the cell and the properly connected into the banana plugs. | | |
| | | Power Supply has failed. | Contact the factory for Warranty Status/Procedures. | | |
| | | | | | |

TROUBLESHOOTING

| Issu | ie / Message Displayed | Problem | Typical Solution |
|------|---|--|---|
| 10) | CHECK SYSTEM Light Flashing. Message Displayed "PURIFIER OFF - Add Salt xxx lbs (No purifier generation during this display) | Salt level extremely low (below 1900 ppm (2.0 g/l) | Same as LOW SALT message below. |
| 11) | CHECK SYSTEM Light Flashing. Message Displayed "Warning! Add Salt XXX Ibs (kg)" | Salt level Low (below 2500 ppm (2,5 g/l)). | Add the amount of salt shown on the displayTest the salt level with a reliable salt test kit and compare to the DIG-220 display Calibrate if needed, see page-22. |
| 12) | CHECK SYSTEM Light Flashing. Message Displayed "Freeze Protect" | Pump runs when no program is on. | Freeze protect function is active. See page-30 for description. |
| 13) | CHECK SYSTEM Light Flashing. Message Displayed "DEMO" instead of "On" or "Off" | Chlorine is not generated. | Disable demo mode, see page-23. |
| 14) | A small dot "walks" across the display. | Display is inactive, but all functions such as purifier are still operational. | Pressing a key will activate the display |
| 15) | CHECK SYSTEM Light Flashing. Message Displayed "Pwr Ctrl Error" | | Contact the factory for Warranty Status Procedures. |
| 16) | CHECK SYSTEM Light Flashing. Message Displayed "Control Error" (No purifier generation during this display) | | Contact the factory for Warranty Status/Procedures. |

<u>APPENDIX</u>

Declaration of Conformity

(according to ISO/IEC Guide 22 and EN 45014)

Manufacturer's Name: Autopilot Systems, Inc.

Manufacturer's Address:

2737 24th Street North, St. Petersburg, Florida USA 33713.

Pool Pilot Digital

declares that the product:

Product Name:

Model Number(s):

DIG-220 + SC-36, SC-48, SC-60, CC-15

to which this declaration relates, meets the essential health and safety requirements and is in conformity with the relevant EU directives listed below:

EU EMC Directive 89/392/EEC

EU Low Voltage Directive 73/23/EEC

using the relevant sections of the following EU standards and other normative documents:

EMC:

Safety:

EN55014-1:1993 + A1:1997 EN55014-2:1995 EN 60335-1:94 + A11:95 + A1:96 + A12:96

Fort Lauderdale, Florida USA March 7 2002 (Place and date ofissue)

Peter Maitland, BSc(Eng), CEng.

FCC Compliance:

NOTE: This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However there is no guarantee that interference will not occur in a particular installation.

If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

-Reorient or relocate the receiving antenna.

- -Increase the separation between the equipment and receiver.
- -Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- -Consult the dealer or an experienced radio/ TV technician for help.

2737 24th St. North St. Petersburg, FL 33713 727-823-5642
